COMPLAINT

Plaintiffs Elan Corporation, plc and Elan Pharma International Ltd. (collectively “Elan”), for their Complaint against Defendant Barr Laboratories, Inc. (“Barr”), allege as follows:

PARTIES

1. Elan Corporation, plc is an Irish corporation having its principal place of business at Treasury Building, Lower Grand Canal St., Dublin 2, Ireland.
2. Elan Pharma International Ltd. is an Irish corporation having its principal place of business at Monksland, Athlone County, Westmeath, Ireland. Elan Pharma International Ltd. is a subsidiary of Elan Corporation, plc.
3. On information and belief, Barr is a Delaware corporation having a place of business at 2 Quaker Road, Pomona, New York 10970, and is engaged in the manufacture and sale of generic drug products.

NATURE OF ACTION

4. This is an action for infringement of United States Patent Nos. 6,228,398 (“the ‘398 patent”) and 6,730,325 (“the ‘325 patent”). This action is based upon the Patent Laws of the United States, 35 U.S.C. § 100 *et seq.*

JURISDICTION AND VENUE

5. This Court has jurisdiction over the subject matter of this action pursuant to 28 U.S.C. §§ 1331 and 1338(a).

6. This Court has personal jurisdiction over Barr because Barr is a Delaware corporation, and because Barr has had continuous and systematic contacts within this judicial district.

7. Venue is proper in this judicial district pursuant to 28 U.S.C. §§ 1391(c) and 1400(b).

FACTUAL BACKGROUND

8. On May 8, 2001, the ‘398 patent, entitled “Multiparticulate Modified Release Composition,” was duly and legally issued to Elan as assignee. Elan owns all rights to the ‘398 patent, including the right to sue for infringement thereof. A true and correct copy of the ‘398 patent is attached as Exhibit A.

9. On May 4, 2004, the ‘325 patent, entitled “Multiparticulate Modified Release Composition,” was duly and legally issued to Elan as assignee. Elan owns all rights to the ‘325 patent, including the right to sue for infringement thereof. A true and correct copy of the ‘325 patent is attached as Exhibit B.

10. On May 26, 2005, the United States Food And Drug Administration (“FDA”) approved new drug application No. 21-802 for FOCALIN® XR capsules, which

contain dexmethylphenidate hydrochloride, under § 505(a) of the Federal Food, Drug and Cosmetic Act, 21 U.S.C. § 355(a), for the treatment of Attention Deficit Hyperactivity Disorder. The '398 and '325 patents are listed in *Approved Drug Products with Therapeutic Equivalence Evaluations* (the "Orange Book") for FOCALIN® XR capsules.

11. On information and belief, Barr submitted to the FDA abbreviated new drug application ("ANDA") No. 79-091 under § 505(j) of the Federal Food, Drug and Cosmetic Act, 21 U.S.C. § 355(j), seeking approval to engage in the commercial manufacture, use, and sale of dexmethylphenidate hydrochloride extended-release capsules in the 5, 10, 15 and 20 mg strengths, as generic versions of the FOCALIN® XR 5, 10, 15 and 20 mg capsules.

12. By letter dated October 5, 2007 (the "Barr Letter"), Barr stated that it had submitted ANDA No. 79-091 seeking approval to manufacture, use, or sell generic dexmethylphenidate hydrochloride extended-release capsules prior to the expiration of the '398 and '325 patents.

13. The Barr Letter also stated that Barr's ANDA included a certification under 21 U.S.C. § 355(j)(2)(A)(vii)(IV) that, in Barr's opinion, the manufacture, use or sale of the proposed generic dexmethylphenidate hydrochloride extended-release capsules described in its ANDA will not infringe any claim of the '398 and '325 patents, and that those claims are invalid.

COUNT I

14. Plaintiffs incorporate each of the preceding paragraphs 1 to 13 as if fully set forth herein.

15. By filing ANDA No. 79-091 for the purpose of obtaining approval to engage in the commercial manufacture, use or sale of its generic dexmethylphenidate

hydrochloride extended-release capsules prior to the expiration of the '398 patent, Barr has committed an act of infringement of the '398 patent under 35 U.S.C. § 271(e)(2).

16. The commercial manufacture, use or sale of Barr's proposed generic dexmethylphenidate hydrochloride extended-release capsules in the United States before the expiration of the '398 patent would infringe one or more claims of that patent.

17. On information and belief, Barr was aware of the existence of the '398 patent and was aware that the filing of its ANDA and certification with respect to the '398 patent constituted infringement of that patent. This is an exceptional case.

COUNT II

18. Plaintiffs incorporate each of the preceding paragraphs 1 to 13 as if fully set forth herein.

19. By filing ANDA No. 79-091 for the purpose of obtaining approval to engage in the commercial manufacture, use or sale of its generic dexmethylphenidate hydrochloride extended-release capsules prior to the expiration of the '325 patent, Barr has committed an act of infringement of the '325 patent under 35 U.S.C. § 271(e)(2).

20. The commercial manufacture, use or sale of Barr's proposed generic dexmethylphenidate hydrochloride extended-release capsules in the United States before the expiration of the '325 patent would infringe one or more claims of that patent.

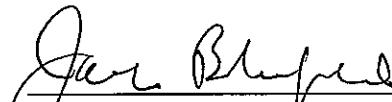

21. On information and belief, Barr was aware of the existence of the '325 patent and was aware that the filing of its ANDA and certification with respect to the '325 patent constituted infringement of that patent. This is an exceptional case.

PRAYER FOR RELIEF

WHEREFORE, Plaintiffs respectfully request the following relief:

- A. A judgment that Barr has infringed the '398 and '325 patents;
- B. An order pursuant to 35 U.S.C. § 271(e)(4)(a) that the effective date of any approval of Barr's ANDA No. 79-091 under § 505(j) of the Federal Food, Drug and Cosmetic Act, 21 U.S.C. § 355(j), be a date which is not earlier than the expiration date of the '398 and '325 patents or any expiration of exclusivity to which Elan is or becomes entitled;
- C. A permanent injunction, pursuant to 35 U.S.C. § 271(e)(4)(B), restraining and enjoining Barr and its officers, agents, attorneys and employees, and those acting in privity or concert with them, from infringement of the '398 and '325 patents for the full terms therof;
- D. A declaration that this is an exceptional case and an award of reasonable attorneys' fees pursuant to 35 U.S.C. § 285;
- E. Costs and expenses in this action; and
- F. Such other and further relief as the Court may deem just and proper.

(57) **ABSTRACT**

The invention relates to a multiparticulate modified release composition that in operation delivers an active ingredient in a pulsed or bimodal manner. The multiparticulate modified release composition comprises an immediate release component and a modified release component; the immediate release component comprising a first population of active ingredient containing particles and the modified release component comprising a second population of active ingredient containing particles coated with a controlled release coating; wherein the combination of the immediate release and modified release components in operation deliver the active ingredient in a pulsed or a bimodal manner. The invention also relates to a solid oral dosage form containing such a multiparticulate modified release composition. The plasma profile achieved by the multiparticulate modified release composition is advantageous in reducing patient tolerance to the active ingredient and in increasing patient compliance by reducing dosage frequency.

MULTIPARTICULATE MODIFIED RELEASE COMPOSITION

This application is a continuation of PCT/US99/25632, filed Nov. 1, 1999, which claims benefit of Ser. No. 60/106726, filed Nov. 2, 1998.

FIELD OF THE INVENTION

The present invention relates to a multiparticulate modified release composition. In particular the present invention relates to a multiparticulate modified release composition that in operation delivers an active ingredient in a pulsatile manner. The present invention further relates to solid oral dosage forms containing such a multiparticulate controlled release composition.

DESCRIPTION OF THE PRIOR ART

The plasma profile associated with the administration of a drug compound may be described as a "pulsatile profile" in which pulses of high active ingredient concentration, interspersed with low concentration troughs, are observed. A pulsatile profile containing two peaks may be described as "bimodal". Similarly, a composition or a dosage form which produces such a profile upon administration may be said to exhibit "pulsed release" of the active ingredient.

Conventional frequent dosage regimes in which an immediate release (IR) dosage form is administered at periodic intervals typically gives rise to a pulsatile plasma profile. In this case, a peak in the plasma drug concentration is observed after administration of each IR dose with troughs (regions of low drug concentration) developing between consecutive administration time points. Such dosage regimes (and their resultant pulsatile plasma profiles) have particular pharmacological and therapeutic effects associated with them. For example, the wash out period provided by the fall off of the plasma concentration of the active ingredient between peaks has been thought to be a contributing factor in reducing or preventing patient tolerance to various types of drugs.

Many controlled release drug formulations are aimed at producing a zero-order release of the drug compound. Indeed, it is often a specific object of these formulations to minimise the peak-to-trough variation in drug plasma levels associated with conventional frequent dosage regimes. However, some of the therapeutic and pharmacological effects intrinsic in a pulsatile system may be lost or diminished as a result of the constant or nearly constant plasma levels achieved by zero-order release drug delivery systems. Thus, a modified release composition or formulation which substantially mimics the release of frequent IR dosage regimes, while reducing the need for frequent dosing, is desirable.

A typical example of a drug which may produce tolerance in patients is methylphenidate. Methylphenidate, or α -phenyl-2-piperidine acetic acid methyl ester, is a stimulant affecting the central nervous and respiratory systems and is primarily used in the treatment of attention deficit disorder. After absorption from the gastrointestinal tract (GIT), drug effects persist for 3-6 hours after oral administration of conventional IR tablets or up to about 8 hours after oral administration of extended release formulations. The total dosage is typically in the range of 5-30 mg per day, in exceptional cases rising to 60 mg/day. Under conventional dosage regimes, methylphenidate is given twice daily, typically with one dose given before breakfast and a second dose given before lunch. The last daily dose is preferably given

2

several hours before retiring. Adverse effects associated with methylphenidate treatment include insomnia and the development of patient tolerance.

WO 98/14168 (Alza Corp.) teaches a dosage form and a method of administering methylphenidate in a sustained and constantly ascending rate. The dosage form disclosed comprises a plurality of beads comprising a hydrogel matrix with increasing amounts of the active ingredient therein, coated with varying amounts of a release rate controlling material.

Appropriate combinations of the active ingredient dose and the number and thickness coating layers can be selected to give an ascending release profile in which the plasma concentration of the active ingredient continually increases over a given period of time. In contrast to the present invention, an object of WO 98/14168 is to provide a dosage form to specifically avoid uneven blood levels (characterised by peaks and troughs) associated with conventional treatments using immediate release dosage formulations.

WO 97/03672 (Chiroscience Ltd.) discloses that methylphenidate exhibits a therapeutic effect when administered in the form of a racemic mixture or in the form of a single isomer (such as the RR d-threo enantiomer). Further, WO 97/03763 (Chiroscience Ltd.) discloses a sustained release formulation containing dmp. This disclosure teaches the use of a composition comprising a coating through which the dmp passes in order to attain sustained release and achieve serum levels (of the active ingredient) of at least 50% c_{max} over a period of at least 8 hours. Thus, this formulation does not deliver the active ingredient in a pulsatile manner.

Shah et al., *J Cont. Rel.* (1989) 9:169-175 discloses that certain types of hydroxypropyl methylcellulose ethers compressed into a solid dosage form with a therapeutic agent may give a bimodal release profile. However, it was noted that while polymers from one supplier yielded a bimodal profile, the same polymers with almost identical product specifications obtained from a different source gave non-bimodal release profiles.

Giunchedi et al., *Int. J. Pharm* (1991) 77:177-181 discloses the use of a hydrophilic matrix multiple-unit formulation for the pulsed release of ketoprofen. Giunchedi et al. teach that ketoprofen is rapidly eliminated from the blood after dosing (plasma half-life 1-3 hours) and consecutive pulses of drug may be more beneficial than constant release for some treatments. The multiple-unit formulation disclosed comprises four identical hydrophilic matrix tablets placed in a gelatin capsule. Although the *in vivo* studies show two peaks in the plasma profile there is no well defined wash out period and the variation between the peak and trough plasma levels is small.

Conte et al., *Drug Dev. Ind. Pharm.*, (1989) 15:2583-2596 and EP 0 274 734 (Pharmidea Srl) teach the use of a three layer tablet for delivery of ibuprofen in consecutive pulses. The three layer tablet is made up of a first layer containing the active ingredient, a barrier layer (the second layer) of semi-permeable material which is interposed between the first layer and a third layer containing an additional amount of active ingredient. The barrier layer and the third layer are housed in an impermeable casing. The first layer dissolves upon contact with a dissolving fluid while the third layer is only available after dissolution or rupture of the barrier layer. In such a tablet the first portion of active ingredient must be released instantly. This approach also requires the provision of a semi-permeable layer between the first and third layers in order to control the relative rates of delivery of the two portions of active ingredient. Additionally, rupture of the semi-permeable layer leads to uncontrolled

US 6,228,398 B1

3

dumping of the second portion of the active ingredient which may not be desirable.

U.S. Pat. No. 5,158,777 (E. R. Squibb & Sons Inc.) discloses a formulation comprising captopril within an enteric or delayed release coated pH stable core combined with additional captopril which is available for immediate release following administration. In order to form the pH stable core, chelating agents such as disodium edetate or surfactants such as polysorbate 80 are used either alone or in combination with a buffering agent. The compositions have an amount of captopril available for immediate release following oral administration and an additional amount of pH stabilised captopril available for release in the colon.

U.S. Pat. Nos. 4,728,512, 4,794,001 and 4,904,476 (American Home Products Corp.) relate to preparations providing three distinct releases. The preparation contains three groups of spheroids containing an active medicinal substance: the first group of spheroids is uncoated and rapidly disintegrates upon ingestion to release an initial dose of medicinal substance; the second group of spheroids is coated with a pH sensitive coat to provide a second dose; and the third group of spheroids is coated with a pH independent coat to provide a third dose. The preparation is designed to provide repeated release of medicinal substances which are extensively metabolised presystemically or have relatively short elimination half-lives.

U.S. Pat. No. 5,837,284 (Mehta et al) discloses a methylphenidate dosage form having immediate release and delayed release particles. The delayed release is provided by the use of ammonio methacrylate pH independent polymers combined with certa fillers.

Accordingly, it is an object of the present invention to provide a multiparticulate modified release composition containing an active ingredient which in operation produces a plasma profile substantially similar to the plasma profile produced by the administration of two or more IR dosage forms given sequentially.

It is a further object of the invention to provide a multiparticulate modified release composition which in operation delivers an active ingredient in a pulsatile manner.

Another object of the invention is to provide a multiparticulate modified release composition which substantially mimics the pharmacological and therapeutic effects produced by the administration of two or more IR dosage forms given sequentially.

Another object of the present invention is to provide a multiparticulate modified release composition which substantially reduces or eliminates the development of patient tolerance to the active ingredient of the composition.

Another object of the invention is to provide a multiparticulate modified release composition in which a first portion of the active ingredient is released immediately upon administration and a second portion of the active ingredient is released rapidly after an initial delay period in a bimodal manner.

Another object of the invention is to provide a multiparticulate modified release composition capable of releasing the active ingredient in a bimodal or multi-modal manner in which a first portion of the active ingredient is released either immediately or after a delay time to provide a pulse of drug release and one or more additional portions of the active ingredient are released each after a respective lag time to provide additional pulses of drug release.

Another object of the invention is to provide solid oral dosage forms comprising a multiparticulate modified release composition of the present invention.

4

Other objects of the invention include provision of a once daily dosage form of methylphenidate which, in operation, produces a plasma profile substantially similar to the plasma profile produced by the administration of two immediate release dosage forms given sequentially and a method for treatment of attention deficit disorder based on administration of such a dosage form.

BRIEF DESCRIPTION OF THE INVENTION

The above objects are realised by a multiparticulate modified release composition having a first component comprising a first population of active ingredient-containing particles and a second component comprising a second population of active ingredient-containing particles. The active ingredient contained in the first and second components can be the same or different and active ingredient-containing particles of the second component are coated with a modified release coating. Alternatively or additionally, the second population of active ingredient-containing particles further comprises a modified release matrix material. Following oral delivery, the composition in operation delivers the active ingredient or active ingredients in a pulsatile manner.

In a preferred embodiment of a multiparticulate modified release composition according to the invention the first component is an immediate release component.

The modified release coating applied to the second population of active ingredient containing particles causes a lag time between the release of active ingredient from the first population of active ingredient containing particles and the release of active ingredient from the second population of active ingredient containing particles. Similarly, the presence of a modified release matrix material in the second population of active ingredient containing particles causes a lag time between the release of active ingredient from the first population of active ingredient containing particles and the release of active ingredient from the second population of active ingredient containing particles. The duration of the lag time may be varied by altering the composition and/or the amount of the modified release coating and/or altering the composition and/or amount of modified release matrix material utilised. Thus, the duration of the lag time can be designed to mimic a desired plasma profile.

Because the plasma profile produced by the multiparticulate modified release composition upon administration is substantially similar to the plasma profile produced by the administration of two or more IR dosage forms given sequentially, the multiparticulate controlled release composition of the present invention is particularly useful for administering active ingredients for which patient tolerance may be problematical. This multiparticulate modified release composition is therefore advantageous for reducing or minimising the development of patient tolerance to the active ingredient in the composition.

In a preferred embodiment of the present invention, the active ingredient is methylphenidate and the composition in operation delivers the active ingredient in a bimodal or pulsed manner. Such a composition in operation produces a plasma profile which substantially mimics that obtained by the sequential administration of two IR doses as, for instance, in a typical methylphenidate treatment regime.

The present invention also provides solid oral dosage forms comprising a composition according to the invention.

The present invention further provides a method of treating an animal, particularly a human in need of treatment utilising the active ingredient, comprising administering a

US 6,228,398 B1

5

therapeutically effective amount of a composition or solid oral dosage form according to the invention to provide pulsed or bimodal administration of the active ingredient.

Advantages of the present invention include reducing the dosing frequency required by conventional multiple IR dosage regimes while still maintaining the benefits derived from a pulsatile plasma profile. This reduced dosing frequency is particularly advantageous in the case of children in that it eliminates the need for dosing during the middle of the school day which can be both disruptive and embarrassing for the patient. It is also advantageous in terms of patient compliance to have a formulation which may be administered at reduced frequency. The reduction in dosage frequency made possible by utilising the present invention would contribute to reducing health care costs by reducing the amount of time spent by health care workers on the administration of drugs. In the case of methylphenidate, and other controlled substances, the use of a once-daily formulation (in place of multiple IR doses) reduces or eliminates the need for the storage of controlled substances on the premises of schools or other institutions.

DESCRIPTION OF THE DRAWINGS

FIG. 1 shows methylphenidate plasma profiles following oral administration of the following three formulations to human volunteers: A—20 mg methylphenidate formulation having an immediate release component comprising particles containing a total of 10 mg methylphenidate (according to Table 1 (ii)) and a modified release component comprising particles containing a total of 10 mg methylphenidate (according to Table 2 (viii); IR particles coated to a 30% weight gain); B—20 mg methylphenidate formulation having an immediate release component comprising particles containing a total 10 mg methylphenidate (according to Table 1 (ii)) and a modified release component comprising particles containing a total of 10 mg methylphenidate (according to Table 2 (vii); IR particles coated to a 30% weight gain); and Control—two doses of 10 mg Ritalin® Hydrochloride (IR) tablets administered at times 0 and 4 hours (total of 20 mg methylphenidate administered).

DETAILED DESCRIPTION OF THE INVENTION

The term "particulate" as used herein refers to a state, of matter which is characterised by the presence of discrete particles, pellets, beads or granules irrespective of their size, shape or morphology. The term "multiparticulate" as used herein means a plurality of discrete, or aggregated, particles, pellets, beads, granules or mixture thereof irrespective of their size, shape or morphology.

The term "modified release" as used herein in relation to the composition according to the invention or a coating or coating material or used in any other context means release which is not immediate release and is taken to encompass controlled release, sustained release and delayed release.

The term "time delay" as used herein refers to the duration of time between administration of the composition and the release of the active ingredient from a particular component.

The term "lag time" as used herein refers to the time between delivery of active ingredient from one component and the subsequent delivery of active ingredient from another component.

The invention will be described in detail with respect to methylphenidate as a specific example of an active ingredient particularly suited to formulation in a multiparticulate modified release composition according to the present invention.

6

The multiparticulate modified release composition of the invention may have more than two active ingredient-containing components. In this case the release of active ingredient from the second and subsequent components is modified such that there is a lag time between the release of active ingredient from the first component and each subsequent component. The number of pulses in the profile arising from such a composition in operation will depend on the number of active ingredient containing components in the composition. A composition containing three active ingredient-containing components will give rise to three pulses in the profile.

Any active ingredient for which it is useful to combine the advantages of a pulsatile plasma profile with a reduced frequency dosage regime may be used in practice of the present invention. Particularly usefull in the practice of the invention include active ingredients whose pharmacological and/or therapeutic effects benefit from having a wash-out period between plasma concentration peaks, such as those active ingredients susceptible to the development of patient tolerance. Example active ingredients include but are not limited to peptides or proteins, hormones, analgesics, anti-migraine agents, anti-coagulant agents, narcotic antagonists, chelating agents, anti-anginal agents, chemotherapy agents, sedatives, anti-neoplastics, prostaglandins and antidiuretic agents, drug compounds acting on the central nervous system such as cerebral stimulants, for example methylphenidate; pain management active ingredients; alkaloids such as opiates, for example morphine; cardiovascular drugs, such as nitrates; and agents for treating rheumatic conditions. It is further appreciated that the present invention may be used to deliver a number of drugs including, but not limited to, peptides, proteins or hormones such as insulin, calcitonin, calcitonin gene regulating protein, atrial natriuretic protein, colony stimulating factor, betaseron, erythropoietin (EPO), interferons such as α , β or γ interferon, somatotropin, somatotropin, somastostatin, insulin-like growth factor (somatomedins), luteinizing hormone releasing hormone (LHRH), tissue plasminogen activator (TPA), growth hormone releasing hormone (GHRH), oxytocin, estradiol, growth hormones, leuprolide acetate, factor VIII, interleukins such as interleukin-2, and analogues thereof; analgesics such as fentanyl, sufentanil, butorphanol, buprenorphine, levorphanol, morphine, hydromorphone, hydrocodone, oxymorphone, methadone, lidocaine, bupivacaine, diclofenac, naproxen, paverin, and analogues thereof; anti-migraine agents such as sumatriptan, ergot alkaloids, and analogues thereof; anti-coagulant agents such as heparin, hirudin, and analogues thereof; anti-emetic agents such as scopolamine, ondansetron, domperidone, metoclopramide, and analogues thereof; cardiovascular agents, anti-hypertensive agents and vasodilators such as diltiazem, clonidine, nifedipine, verapamil, isosorbide-5-mononitrate, organic nitrates, agents used in treatment of heart disorders, and analogues thereof; sedatives such as benzodiazepines, phenothiazines, and analogues thereof; chelating agents such as deferoxamine, and analogues thereof; anti-diuretic agents such as desmopressin, vasopressin, and analogues thereof; anti-anginal agents such as nitroglycerine, and analogues thereof; anti-neoplastics such as fluorouracil, bleomycin, and analogues thereof; prostaglandins and analogues thereof; and chemotherapy agents such as vincristine, and analogues thereof.

The active ingredient in each component may be the same or different. For example, a composition in which the first component contains a first active ingredient and the second component comprises a second active ingredient may be

US 6,228,398 B1

7

desirable for combination therapies. Indeed, two or more active ingredients may be incorporated into the same component when the active ingredients are compatible with each other. A drug compound present in one component of the composition may be accompanied by, for example, an enhancer compound or a sensitiser compound in another component of the composition, in order to modify the bioavailability or therapeutic effect of the drug compound.

As used herein, the term "enhancer" refers to a compound which is capable of enhancing the absorption and/or bioavailability of an active ingredient by promoting net transport across the GIT in an animal, such as a human. Enhancers include but are not limited to medium chain fatty acids; salts, esters, ethers and derivatives thereof, including glycerides and triglycerides; non-ionic surfactants such as those that can be prepared by reacting ethylene oxide with a fatty acid, a fatty alcohol, an alkylphenol or a sorbitan or glycerol fatty acid ester; cytochrome P450 inhibitors, P-glycoprotein inhibitors and the like; and mixtures of two or more of these agents.

The proportion of active ingredient contained in each component may be the same or different depending on the desired dosing regime. The active ingredient may be present, in the first component individually or in combination with the active ingredient (or active ingredients) in the second component, in any amount sufficient to elicit a therapeutic response. The active ingredient (or active ingredients), when applicable, may be present either in the form of one substantially optically pure enantiomer or as a mixture, racemic or otherwise, of enantiomers. The active ingredient is preferably present in a composition in an amount of from 0.1–500 mg, preferably in the amount of from 1–100 mg. When the active ingredient is methylphenidate, it is preferably present in the first component in an amount of from 0.5–60 mg; more preferably the active ingredient is present in the first component in an amount of from 2.5–30 mg. The active ingredient is present in the subsequent components in an amount within a similar range to that described for the first component.

The time release characteristics for the release of the active ingredient from each of the components may be varied by modifying the composition of each component, including modifying any of the excipients or coatings which may be present. In particular the release of the active may be controlled by changing the composition and/or the amount of the modified release coating on the particles, if such a coating is present. If more than one modified release component is present, the modified release coating for each of these components may be the same or different. Similarly, when modified release is facilitated by the inclusion of a modified release matrix material, release of the active ingredient may be controlled by the choice and amount of modified release matrix material utilised. The modified release coating may be present, in each component, in any amount that is sufficient to yield the desired delay time for each particular component. The modified release coating may be preset, in each component, in any amount that is sufficient to yield the desired time lag between components.

The lag time or delay time for the release of the active ingredient from each component may also be varied by modifying the composition of each of the components, including modifying any excipients and coatings which may be present. For example the first component may be an immediate release component wherein the active ingredient is released substantially immediately upon administration. Alternatively, the first component may be, for example, a time-delayed immediate release component in which the active ingredient is released substantially immediately after a time delay. The second component may be, for example, a time-delayed immediate release component as just

8

described or, alternatively, a time-delayed sustained release or extended release component in which the active ingredient is released in a controlled fashion over an extended period of time.

As will be appreciated by those skilled in the art, the exact nature of the plasma concentration curve will be influenced by the combination of all of these factors just described. In particular, the lag time between the delivery (and thus also the on-set of action) of the active ingredient in each component may be controlled by varying the composition and coating (if present) of each of the components. Thus by variation of the composition of each component (including the amount and nature of the active ingredient(s)) and by variation of the lag time, numerous release and plasma profiles may be obtained. Depending on the duration of the lag time between the release of active ingredient from each component and the nature of the release from each component (i.e. immediate release, sustained release etc.), the pulses in the plasma profile may be well separated and clearly defined peaks (e.g. when the lag time is long) or the pulses may be superimposed to a degree (e.g. in when the lag time is short).

In a preferred embodiment, the multiparticulate modified release composition according to the present invention has an immediate release component and at least one modified release component, the immediate release component comprising a first population of active ingredient containing particles and the modified release components comprising second and subsequent populations of active ingredient containing particles. The second and subsequent modified release components may comprise a controlled release coating. Additionally or alternatively, the second and subsequent modified release components may comprise a modified release matrix material. In operation, administration of such a multiparticulate modified release composition having, for example, a single modified release component results in characteristic pulsatile plasma concentration levels of the active ingredient in which the immediate release component of the composition gives rise to a first peak in the plasma profile and the modified release component gives rise to a second peak in the plasma profile. Embodiments of the invention comprising more than one modified release component give rise to further peaks in the plasma profile.

Such a plasma profile produced from the administration of a single dosage unit is advantageous when it is desirable to deliver two (or more) pulses of active ingredient without the need for administration of two (or more) dosage units. Additionally, in the case of some disorders it is particularly useful to have such a bimodal plasma profile. For example, a typical methylphenidate treatment regime consists of administration of two doses of an immediate release dosage formulation given four hours apart. This type of regime has been found to be therapeutically effective and is widely used. The plasma profile produced by such an administration regime is illustrated by the "Control" curve in FIG. 1. As previously mentioned, the development of patient tolerance is an adverse effect sometimes associated with methylphenidate treatments. It is believed that the trough in the plasma profile between the two peak plasma concentrations is advantageous in reducing the development of patient tolerance by providing a period of wash out of the active ingredient. Drug delivery systems which provide zero order or pseudo zero order delivery of the active ingredient do not facilitate this wash out process.

Any coating material which modifies the release of the active ingredient in the desired manner may be used. In particular, coating materials suitable for use in the practice of the invention include but are not limited to polymer coating materials, such as cellulose acetate phthalate, cellulose acetate trimaleate, hydroxy propyl methylcellulose

US 6,228,398 B1

9

phthalate, polyvinyl acetate phthalate, ammonio methacrylate copolymers such as those sold under the Trade Mark Eudragit® RS and RL, poly acrylic acid and poly acrylate and methacrylate copolymers such as those sold under the Trade Mark Eudragit® S and L, polyvinyl acetaldieethylamino acetate, hydroxypropyl methylcellulose acetate succinate, shellac; hydrogels and gel-forming materials, such as carboxyvinyl polymers, sodium alginate, sodium carmellose, calcium carmellose, sodium carboxymethyl starch, poly vinyl alcohol, hydroxyethyl cellulose, methyl cellulose, gelatin, starch, and cellulose based cross-linked polymers in which the degree of crosslinking is low so as to facilitate adsorption of water and expansion of the polymer matrix, hydroxypropyl cellulose, hydroxypropyl methylcellulose, polyvinylpyrrolidone, crosslinked starch, microcrystalline cellulose, chitin, aminoacryl-methacrylate copolymer (Eudragit® RS-PM, Rohm & Haas), pullulan, collagen, casein, agar, gum arabic, sodium carboxymethyl cellulose, (swellable hydrophilic polymers) poly (hydroxyalkyl methacrylate) (m. wt. ~5k-5,000k), polyvinylpyrrolidone (m. wt. ~10k-360k), anionic and cationic hydrogels, polyvinyl alcohol having a low acetate residual, a swellable mixture of agar and carboxymethyl cellulose, copolymers of maleic anhydride and styrene, ethylene, propylene or isobutylene, pectin (m. wt. ~30k-300k), polysaccharides such as agar, acacia, karaya, tragacanth, algin and guar, polyacrylamides, Polyox® polyethylene oxides (m. wt. ~100k-5,000k), AquaKeep® acrylate polymers, diesters of polyglucan, crosslinked polyvinyl alcohol and poly N-vinyl-2-pyrrolidone, sodium starch glucolate (e.g. Explotab®; Edward Mandell C. Ltd.); hydrophilic polymers such as polysaccharides, methyl cellulose, sodium or calcium carboxymethyl cellulose, hydroxypropyl methyl cellulose, hydroxypropyl cellulose, hydroxyethyl cellulose, nitro cellulose, carboxymethyl cellulose, cellulose ethers, polyethylene oxides (e.g. Polyox®, Union Carbide), methyl ethyl cellulose, ethylhydroxy ethylcellulose, cellulose acetate, cellulose butyrate, cellulose propionate, gelatin, collagen, starch, maltodextin, pullulan, polyvinyl pyrrolidone, polyvinyl alcohol, polyvinyl acetate, glycerol fatty acid esters, polyacrylamide, polyacrylic acid, copolymers of methacrylic acid or methacrylic acid (e.g. Eudragit®, Rohm and Haas), other acrylic acid derivatives, sorbitan esters, natural gums, lecithins, pectin, alginates, ammonia alginate, sodium, calcium, potassium alginates, propylene glycol alginate, agar, and gums such as arabic, karaya, locust bean, tragacanth, carrageens, guar, xanthan, scleroglucan and mixtures and blends thereof. As will be appreciated by the person skilled in the art, excipients such as plasticisers, lubricants, solvents and the like may be added to the coating. Suitable plasticisers include for example acetylated monoglycerides; butyl phthalyl butyl glycolate; dibutyl tartrate; diethyl phthalate; dimethyl phthalate; ethyl phthalyl ethyl glycolate; glycerin; propylene glycol; triacetin; citrate; tripropioin; diacetin; dibutyl phthalate; acetyl monoglyceride; polyethylene glycols; castor oil; triethyl citrate; polyhydric alcohols, glycerol, acetate esters, glycerol triacetate, acetyl triethyl citrate, dibenzyl phthalate, dibutyl phthalate, butyl octyl phthalate, diisononyl phthalate, butyl octyl phthalate, diocetyl azelate, epoxidised tallate, triisooctyl trimellitate, diethylhexyl phthalate, di-n-octyl phthalate, di-i-octyl phthalate, di-i-decyl phthalate, di-n-undecyl phthalate, di-n-tridecyl phthalate, tri-2-ethylhexyl trimellitate, di-2-ethylhexyl adipate, di-2-ethylhexyl sebacate, di-2-ethylhexyl azelate, dibutyl sebacate.

When the modified release component comprises a modified release matrix material, any suitable modified release matrix material or suitable combination of modified release matrix materials may be used. Such materials are known to those skilled in the art. The term "modified release matrix

10

material" as used herein includes hydrophilic polymers, hydrophobic polymers and mixtures thereof which are capable of modifying the release of an active ingredient dispersed therein *in vitro* or *in vivo*. Modified release matrix materials suitable for the practice of the present invention include but are not limited to microcrystalline cellulose, sodium carboxymethylcellulose, hydroxyalkylcelluloses such as hydroxypropylmethylecellulose and hydroxypropylcellulose, polyethylene oxide, alkylcelluloses such as methylcellulose and ethylcellulose, polyethylene glycol, polyvinylpyrrolidone, cellulose acetate, cellulose acetate butyrate, cellulose acetate phthalate, cellulose acetate trimellitate, polyvinylacetate phthalate, polyalkylmethacrylates, polyvinyl acetate and mixture thereof.

A multiparticulate modified release composition according to the present invention may be incorporated into any suitable dosage form which facilitates release of the active ingredient in a pulsatile manner. Typically, the dosage form may be a blend of the different populations of active ingredient containing particles which make up the immediate release and the modified release components, the blend being filled into suitable capsules, such as hard or soft gelatin capsules. Alternatively, the different individual populations of active ingredient containing particles may be compressed (optionally with additional excipients) into mini-tablets which may be subsequently filled into capsules in the appropriate proportions. Another suitable dosage form is that of a multilayer tablet. In this instance the first component of the multiparticulate modified release composition may be compressed into one layer, with the second component being subsequently added as a second layer of the multilayer tablet. The populations of active ingredient containing particles making up the composition of the invention may further be included in rapidly dissolving dosage forms such as an effervescent dosage form or a fast-melt dosage form.

The composition according to the invention comprises at least two populations of active ingredient containing particles which have different *in vitro* dissolution profiles.

Preferably, in operation the composition of the invention and the solid oral dosage forms containing the composition release the active ingredient such that substantially all of the active ingredient contained in the first component is released prior to release of the active ingredient from the second component. When the first component comprises an IR component, for example, it is preferable that release of the active ingredient from the second component is delayed until substantially all the active ingredient in the IR component has been released. Release of the active ingredient from the second component may be delayed as detailed above by the use of a modified release coating and/or a modified release matrix material.

More preferably, when it is desirable to minimise patient tolerance by providing a dosage regime which facilitates wash-out of a first dose of active ingredient from a patient's system, release of the active ingredient from the second component is delayed until substantially all of the active ingredient contained in the first component has been released, and further delayed until at least a portion of the active ingredient released from the first component has been cleared from the patient's system. In a preferred embodiment, release of the active ingredient from the second component of the composition in operation is substantially, if not completely, delayed for a period of at least about two hours after administration of the composition.

When the active ingredient is methylphenidate, release of the active ingredient from the second component of the composition in operation is substantially, if not completely,

US 6,228,398 B1

11

delayed for a period of at least about four hours, preferably about four hours, after administration of the composition.

In the following Examples all percentages are weight by weight unless otherwise stated. The term "purified water" as used throughout the Examples refers to water that has been purified by passing it through a water filtration system.

EXAMPLE 1

Multiparticulate Modified Release Composition
Containing Methylphenidate

A multiparticulate modified release composition according to the present invention comprising an immediate release component and a modified release component and containing methylphenidate as the active ingredient is prepared as follows.

(a) Immediate release component.

A solution of methylphenidate HCl (50:50 racemic mixture) is prepared according to any of the formulations given in Table 1. The methylphenidate solution is then coated onto nonpareil seeds to a level of approximately 16.9% solids weight gain using, for example, a Glatt GPCG3 (Glatt, ProTech Ltd., Leicester, UK) fluid bed coating apparatus to form the IR particles of the immediate release component.

TABLE 1

<u>Immediate release component solutions</u>		
Ingredient	(i)	(ii)
Methylphenidate HCl	13.0	13.0
Polyethylene Glycol 6000	0.5	0.5
Polyvinylpyrrolidone	3.5	
Purified Water	83.5	86.5

(b) Modified release component.

Methylphenidate containing delayed release particles are prepared by coating immediate release particles prepared according to Example 1(a) above with a modified release coating solution as detailed in Table 2. The immediate release particles are coated to varying levels up to approximately to 30% weight gain using, for example, a fluid bed apparatus.

12

(c) Dissolution testing

pH independent coated components ((i) to (v) Table 2) are tested in vitro in USP Type 1 apparatus (100 rpm) according to the following protocol: the sample is placed in 0.01 N HCl (900 ml), pH 2.0, 37° C. for all of the sampling time points.

pH dependent coated components ((vi) to (viii) Table 2) are tested in USP Type 1 apparatus (100 rpm) according to a modified version of the United States Pharmacopoeia method for enteric protection (U.S. Pat. No. 23,1995, p.1795); the sample is placed for 2 hours in 0.01 N HCl and then transferred to phosphate buffer pH 6.8 for the remainder of the sampling time points.

IR components were formulated using three different sizes of non-pareil seeds having diameter dimensions of 0.5–0.6, 0.6–0.71 and 0.71–0.85 mm, respectively. The IR particles formed by coating 0.5–0.6, 0.6–0.71 and 0.71–0.85 mm nonpareil seeds were found to release 100% of the active ingredient within 20 minutes in aqueous media.

Dissolution data for the modified release components prepared according to Example 1(b) above are shown in Tables 3 (a) to 3 (c). This data shows that release characteristics of the modified release component can be varied by changing the composition and thickness of the coating applied.

10	94.4	—	60.0	—	—	79.5	73.4	—

(the notation "—" indicates no measurement taken; "*" indicates pH of phosphate buffer was 7.4 instead of 6.8)

(d) Encapsulation of immediate and delayed release particles.

The immediate and delayed release particles prepared according to Example 1(a) and (b) above are encapsulated in size 2 hard gelatin capsules to an overall 20 mg dosage strength using, for example, a Bosch GKF 4000S encapsulation apparatus. The overall dosage strength of 20 mg methylphenidate was made up of 10 mg from the immediate release component and 10 mg from the modified release component.

Table 4 shows the dissolution profiles for two multiparticulate modified release compositions prepared using the immediate release coating solution given in Table 1 (ii) and the modified release coating solutions given in Table 2 (vii) and (viii). These results indicate that approximately 50% of the methylphenidate HCl active ingredient was released within the first half hour with release from the modified release component being delayed for about four hours.

TABLE 4

Dissolution data for compositions containing an IR component and a modified release component.

MR coating formulation Coating level (% weight increase) Time (hr)	(vii)	(viii)
	30%	30%
	% Active ingredient released	
0	0	0
0.5	49.7	50.2

TABLE 4-continued

Dissolution data for compositions containing an IR component and a modified release component.

5	MR coating formulation Coating level (% weight increase) Time (hr)	(vii) 30%	(viii) 30%
10	1	49.7	50.5
	2	49.8	51.1
	4	56.1	54.1
	6	65.2	68.0
	8	72.2	81.8
	10	76.6	87.0

20 The dissolution profiles shown in Table 4 indicate that the compositions containing the pH dependent coated components release the methylphenidate active ingredient in a pulsed manner. A first pulse occurs before 1 hour followed by a plateau region where the release of further amounts of the active ingredient is suppressed. The plateau region is in turn followed by a second pulse of active ingredient release as indicated by the increase in drug concentration from 4 hours onward.

EXAMPLE 2

Multiparticulate Modified Erelease Composition
Containing Methylphenidate

30 Multiparticulate modified release methylphenidate compositions according to the present invention having an immediate release component and a modified release component having a modified release matrix material are prepared according to the formulations shown in Table 5 (a) and (b).

TABLE 5 (a)

40 100 mg of IR component is encapsulated with 100 mg of modified release (MR) component to give a 20 mg dosage strength product

60 (e) In vivo release

In a human cross-over biostudy, fasted healthy volunteers were dosed with 20 mg methylphenidate HCl compositions according to the present invention to compare the bioavailability of methylphenidate HCl in these compositions relative to Ritalin® (Novartis; 10 mg dosed twice at a four hour interval). Pharmacokinetic assessment was based on the

US 6,228,398 B1

15

plasma levels of methylphenidate measured by blood sampling at regular intervals up to 48 hours after administration. Blood samples were also taken for pre- and post-study screening.

Referring now to FIG. 1, the plasma profiles labelled "A" (modified component comprises IR particles coated with coating Table 2 (viii) at 30%) and "B" (modified component comprises IR particles coated with coating Table 2 (vii) at 30%) correspond to the plasma concentrations of methylphenidate observed in human volunteers after oral administration of the multiparticulate modified release compositions prepared according to Example 1. In both cases the plasma profile is qualitatively similar to the control, typical of prior art treatments (labelled "Control" in FIG. 1), which consists of two doses of Ritalin® IR given sequentially, four hours apart.

For the multiparticulate modified release composition according to the present invention prepared according to Example 1 above, the first peak in the plasma profile associated with the immediate release component is similar in terms of c_{max} and peak width to the peak associated with the first dose of Ritalin® in the control profile. Profile A shows that the trough characteristic of the conventional twice daily administration (as exemplified by the control profile) is mimicked by the composition prepared according to the invention. Profile B also shows a significant fall off after the initial peak in plasma concentration. For both multiparticulate modified release compositions, the effect of the modified release component is to increase plasma concentrations four hours after administration resulting in a second peak level. This observed effect again mimics the control.

From FIG. 1 it is clear that the multiparticulate modified release compositions prepared according to the present invention mimic a typical twice daily treatment (represented by the control) in terms of the plasma profile achieved upon administration. This *in vivo* release of methylphenidate from compositions according to the invention was achieved without any loss in bioavailability compared to Ritalin® dosed twice daily.

In a separate study, 34 children with ADHD were dosed with 20 mg methylphenidate HCl compositions according to the present invention. A simulated classroom design was used to compare formulations "A" and "B" (corresponding to the "A" and "B," formulations described above) with placebo. Pharmacodynamic assessments were conducted over a 9 hour time period which measured both attention and deportment as measured on the SKAMP scale and functional outcome as measured by the number of math problems attempted and the number of correct answers. Each formulation demonstrated a statistical difference from placebo on all efficacy measurements. The individual efficacy evaluations showed that the "A" and "B" formulations proved to be similar with regard to deportment. With regard to attention and functional outcome, the children on the "A" formulation appeared to focus more on the tasks at hand and attempted more math problems more quickly between 4 and 6 hours than the children taking the "B" formulation.

The present invention is not to be limited in scope by the specific embodiments described herein. Various modifications of the invention in addition to those described herein will become apparent to those skilled in the art from the foregoing description and the following claims.

What is claimed is:

1. A multiparticulate modified release composition containing at least one active ingredient and having a first component comprising a first population of active

16

ingredient-containing particles and at least one subsequent component, each subsequent component comprising a subsequent population of active ingredient-containing particles, the active ingredient contained in the first and subsequent components being the same or different; wherein the at least one subsequent population of active ingredient containing particles further comprises a modified release coating or, alternatively or additionally, a modified release matrix material, such that the composition following oral delivery to a subject delivers the active ingredient or active ingredients in a pulsatile manner.

2. The multiparticulate modified release composition according to claim 1, wherein the composition comprises a first component and one subsequent component.

3. The multiparticulate modified release composition according to claim 2, wherein the first component comprises an immediate release component and the subsequent component is a modified release component.

4. The multiparticulate modified release composition according to claim 3, wherein the modified release component comprises particles having a modified release coating.

5. The multiparticulate modified release composition according to claim 3, wherein the modified release component comprises a modified release matrix material.

6. The multiparticulate modified release composition according to claim 1, wherein the first population of active ingredient-containing particles and the at least one subsequent population of active ingredient-containing particles comprise the same active ingredient.

7. The multiparticulate modified release composition according to claim 1, wherein the first population of active ingredient-containing particles contains two or more active ingredients.

8. The multiparticulate modified release composition according to claim 1, wherein the at least one subsequent population of active ingredient-containing particles contains two or more active ingredients.

9. The multiparticulate modified release composition according to claim 1, wherein the active ingredient comprises substantially one optically pure enantiomer or a mixture, racemic or otherwise, of enantiomers.

10. The multiparticulate modified release composition according to claim 1, wherein at least one of the first and subsequent components further comprise an enhancer.

11. The multiparticulate modified release composition according to claim 1, wherein the amount of active ingredient contained in the first and subsequent components is the same or different.

12. The multiparticulate modified release composition according to claim 11, wherein the amount of active ingredient contained in each component is from about 0.1 mg to about 1 g.

13. The multiparticulate modified release composition according to claim 6, wherein the active ingredient is methylphenidate or a pharmaceutically acceptable salt thereof, an enantiomer or mixtures thereof or mixtures thereof.

14. The multiparticulate modified release composition according to claim 1, wherein the first and subsequent populations of active ingredient-containing particles have different *in vitro* dissolution profiles.

15. The multiparticulate modified release composition according to claim 1, wherein the first component is an immediate release component and the at least one subsequent component is a modified release component.

16. The multiparticulate modified release composition according to claim 15, which in operation releases substan-

US 6,228,398 B1

17

tially all of the active ingredient from the first population of active ingredient-containing particles prior to release of the active ingredient from the subsequent population of active ingredient-containing particles.

17. The multiparticulate modified release composition according to claim 1, wherein the in vivo release of the active ingredient in the subject mimics the in vivo release of the same active ingredient administered in the form of two or more doses of immediate release forms of the active ingredient.

18. The multiparticulate modified release composition according to claim 13, wherein the in vivo release of the active ingredient in the subject mimics the in vivo release of the same active ingredient administered in the form of two or more doses of immediate release forms of the active ingredient.

19. The multiparticulate modified release composition according to claim 16, wherein the mean in vitro dissolution profile in an aqueous medium is such that about 50 to 100% of the active ingredient contained in the first population of active ingredient containing particles is released within four hours, and about 25 to 55% of the active ingredient contained in the subsequent population of active ingredient containing particles is released between four and eight hours.

20. The multiparticulate modified release composition according to claim 19, wherein the mean in vitro dissolution profile in an aqueous medium is such that about 80 to 100% of the active ingredient contained in the first population of active ingredient containing particles is released within four hours, and about 28 to 55% of the active ingredient contained in the subsequent population of active ingredient containing particles is released between four and eight hours.

21. A solid oral dosage form comprising a multiparticulate modified release composition according to claim 1.

22. The solid oral dosage form according to claim 21 comprising a blend of first and subsequent active ingredient-containing particles filled into hard gelatin or soft gelatin capsules.

23. The solid oral dosage form according to claim 21, wherein the first and subsequent components are separately and independently compressed into mini-tablets and filled into hard or soft gelatin capsules.

24. The solid oral dosage form according to claim 21, wherein the first component is compressed into the first layer of a multilayer tablet and the at least one subsequent component is compressed into a subsequent layer of the multilayer tablet.

25. The solid oral dosage form according to claim 21, wherein the first and subsequent components are incorporated in a rapidly dissolving dosage form.

26. The solid oral dosage form according to claim 25, wherein the rapidly dissolving dosage form is a fast-melt tablet dosage form.

27. A method, wherein a multiparticulate modified release composition comprising:

a. a first population of active ingredient containing particles and

18

b. at least one subsequent population of active ingredient containing particles, wherein the subsequent population of active ingredient containing particles further comprises a coating selected from the group consisting of a modified release coating and a modified release matrix material, and wherein oral administration of the composition to a subject in need of the active ingredient releases the active ingredient in a pulsatile manner.

28. The method of claim 27, wherein the in vitro dissolution profile of the multiparticulate modified release composition in an aqueous medium is such that about 50% of the total active ingredient is released within about 30 minutes, about 4% of the total active ingredient is released between about 30 minutes and 4 hours, and about 28% of the active ingredient is released between about four hours and eight hours.

29. The method of claim 27, wherein the active ingredient is an active ingredient for the treatment of attention deficit disorder.

30. A method of treatment of a condition which is characterised by the build up of patient tolerance to an active ingredient administered in the treatment of the condition comprising administering a therapeutically effective amount of a multiparticulate modified release composition according to claim 1.

31. A method of treatment of attention deficit disorder comprising administering a therapeutically effective amount of a multiparticulate modified release composition according to claim 1.

32. A method of treatment of attention deficit disorder comprising administering a therapeutically effective amount of a multiparticulate modified release composition according to claim 13.

33. The composition according to claim 3, wherein the modified release component comprises a pH dependent polymer coating that releases a pulse of active ingredient from the modified release component following a delay time.

34. The composition according to claim 33, wherein the pH dependent polymer coating comprises methacrylate copolymers.

35. The composition according to claim 33, wherein the pH dependent polymer coating comprises a mixture of methacrylate and ammonio methacrylate copolymers in a ratio sufficient to achieve a pulse of active ingredient from the modified release component following a delay time.

36. The composition according to claim 35, where the ratio of methacrylate to ammonio methacrylate copolymers is 1:1.

37. The method of claim 28, wherein the active ingredient is selected from the group consisting of methylphenidate, a pharmaceutically acceptable salt of methylphenidate, an enantiomer of methylphenidate and a mixture of methylphenidate, a pharmaceutically acceptable salt of methylphenidate and an enantiomer of methylphenidate.

(57) **ABSTRACT**

The invention relates to a multiparticulate modified release composition that in operation delivers an active ingredient in a pulsed or bimodal manner. The multiparticulate modified release composition comprises an immediate release component and a modified release component; the immediate release component comprising a first population of active ingredient containing particles and the modified release component comprising a second population of active ingredient containing particles coated with a controlled release coating; wherein the combination of the immediate release and modified release components in operation deliver the active ingredient in a pulsed or a bimodal manner. The invention also relates to a solid oral dosage form containing such a multiparticulate modified release composition. The plasma profile achieved by the multiparticulate modified release composition is advantageous in reducing patient tolerance to the active ingredient and in increasing patient compliance by reducing dosage frequency.

MULTIPARTICULATE MODIFIED RELEASE COMPOSITION

This application is a continuation of 09/566,636 filed May. 08, 2000 now U.S. Pat. 6,228,398, which is a continuation of PCT/US99/25 632 filed Nov. 01, 1999, which is a claims benefits of 60/106,726 filed Nov. 02, 1998.

FIELD OF THE INVENTION

The present invention relates to a multiparticulate modified release composition. In particular the present invention relates to a multiparticulate modified release composition that in operation delivers an active ingredient in a pulsatile manner. The present invention further relates to solid oral dosage forms containing such a multiparticulate controlled release composition.

DESCRIPTION OF THE PRIOR ART

The plasma profile associated with the administration of a drug compound may be described as a "pulsatile profile" in which pulses of high active ingredient concentration, interspersed with low concentration troughs, are observed. A pulsatile profile containing two peaks may be described as "bimodal". Similarly, a composition or a dosage form which produces such a profile upon administration may be said to exhibit "pulsed release" of the active ingredient.

Conventional frequent dosage regimes in which an immediate release (IR) dosage form is administered at periodic intervals typically gives rise to a pulsatile plasma profile. In this case, a peak in the plasma drug concentration is observed after administration of each IR dose with troughs (regions of low drug concentration) developing between consecutive administration time points. Such dosage regimes (and their resultant pulsatile plasma profiles) have particular pharmacological and therapeutic effects associated with them. For example, the wash out period provided by the fall off of the plasma concentration of the active ingredient between peaks has been thought to be a contributing factor in reducing or preventing patient tolerance to various types of drugs.

Many controlled release drug formulations are aimed at producing a zero-order release of the drug compound. Indeed, it is often a specific object of these formulations to minimise the peak-to-trough variation in drug plasma levels associated with conventional frequent dosage regimes. However, some of the therapeutic and pharmacological effects intrinsic in a pulsatile system may be lost or diminished as a result of the constant or nearly constant plasma levels achieved by zero-order release drug delivery systems. Thus, a modified release composition or formulation which substantially mimics the release of frequent IR dosage regimes, while reducing the need for frequent dosing, is desirable.

A typical example of a drug which may produce tolerance in patients is methylphenidate. Methylphenidate, or α -phenyl-2-piperidine acetic acid methyl ester, is a stimulant affecting the central nervous and respiratory systems and is primarily used in the treatment of attention deficit disorder. After absorption from the gastrointestinal tract (GIT), drug effects persist for 3-6 hours after oral administration of conventional IR tablets or up to about 8 hours after oral administration of extended release formulations. The total dosage is typically in the range of 5-30 mg per day, in exceptional cases rising to 60 mg/day. Under conventional dosage regimes, methylphenidate is given twice daily, typically with one dose given before breakfast and a second dose

given before lunch. The last daily dose is preferably given several hours before retiring. Adverse effects associated with methylphenidate treatment include insomnia and the development of patient tolerance.

WO 98/14168 (Alza Corp.) teaches a dosage form and a method of administering methylphenidate in a sustained and constantly ascending rate. The dosage form disclosed comprises a plurality of beads comprising a hydrogel matrix with increasing amounts of the active ingredient therein, coated with varying amounts of a release rate controlling material. Appropriate combinations of the active ingredient dose and the number and thickness coating layers can be selected to give an ascending release profile in which the plasma concentration of the active ingredient continually increases over a given period of time. In contrast to the present invention, an object of WO 98/14168 is to provide a dosage form to specifically avoid uneven blood levels (characterised by peaks and troughs) associated with conventional treatments using immediate release dosage formulations.

WO 97/03672 (Chiroscience Ltd.) discloses that methylphenidate exhibits a therapeutic effect when administered in the form of a racemic mixture or in the form of a single isomer (such as the RR d-threo enantiomer). Further, WO 97/03763 (Chiroscience Ltd.) discloses a sustained release formulation containing dtmp. This disclosure teaches the use of a composition comprising a coating through which the dtmp passes in order to attain sustained release and achieve serum levels (of the active ingredient) of at least 50% c_{max} over a period of at least 8 hours. Thus, this formulation does not deliver the active ingredient in a pulsatile manner.

Shah et al., *J. Cont. Rel.* (1989) 9:169-175 discloses that certain types of hydroxypropyl methylcellulose ethers compressed into a solid dosage form with a therapeutic agent may give a bimodal release profile. However, it was noted that while polymers from one supplier yielded a bimodal profile, the same polymers with almost identical product specifications obtained from a different source gave non-bimodal release profiles.

Giunchedi et al., *Int. J. Pharm.* (1991) 77:177-181 discloses the use of a hydrophilic matrix multiple-unit formulation for the pulsed release of ketoprofen. Giunchedi et al. teach that ketoprofen is rapidly eliminated from the blood after dosing (plasma half-life 1-3 hours) and consecutive pulses of drug may be more beneficial than constant release for some treatments. The multiple-unit formulation disclosed comprises four identical hydrophilic matrix tablets placed in a gelatin capsule. Although the *in vivo* studies show two peaks in the plasma profile there is no well defined wash out period and the variation between the peak and trough plasma levels is small.

Conte et al., *Drug Dev. Ind. Pharm.*, (1989) 15:2583-2596 and EP 0 274 734 (Pharmidea Srl) teach the use of a three layer tablet for delivery of ibuprofen in consecutive pulses. The three layer tablet is made up of a first layer containing the active ingredient, a barrier layer (the second layer) of semi-permeable material which is interposed between the first layer and a third layer containing an additional amount of active ingredient. The barrier layer and the third layer are housed in an impermeable casing. The first layer dissolves upon contact with a dissolving fluid while the third layer is only available after dissolution or rupture of the barrier layer. In such a tablet the first portion of active ingredient must be released instantly. This approach also requires the provision of a semi-permeable layer between the first and third layers in order to control the relative rates of delivery of the two portions of active ingredient. Additionally, rup-

US 6,730,325 B2

3

ture of the semi-permeable layer leads to uncontrolled dumping of the second portion of the active ingredient which may not be desirable.

U.S. Pat. No. 5,158,777 (E. R. Squibb & Sons Inc.) discloses a formulation comprising captopril within an enteric or delayed release coated pH stable core combined with additional captopril which is available for immediate release following administration. In order to form the pH stable core, chelating agents such as disodium edetate or surfactants such as polysorbate 80 are used either alone or in combination with a buffering agent. The compositions have an amount of captopril available for immediate release following oral administration and an additional amount of pH stabilised captopril available for release in the colon.

U.S. Pat. No. 4,728,512, U.S. 4,794,001 and U.S. 4,904,476 (American Home Products Corp.) relate to preparations providing three distinct releases. The preparation contains three groups of spheroids containing an active medicinal substance: the first group of spheroids is uncoated and rapidly disintegrates upon ingestion to release an initial dose of medicinal substance; the second group of spheroids is coated with a pH sensitive coat to provide a second dose; and the third group of spheroids is coated with a pH independent coat to provide a third dose. The preparation is designed to provide repeated release of medicinal substances which are extensively metabolised presystemically or have relatively short elimination half-lives.

U.S. Pat. No. 5,837,284 (Mehta et al) discloses a methylphenidate dosage form having immediate release and delayed release particles. The delayed release is provided by the use of ammonio methacrylate pH independent polymers combined with certain fillers.

Accordingly, it is an object of the present invention to provide a multiparticulate modified release composition containing an active ingredient which in operation produces a plasma profile substantially similar to the plasma profile produced by the administration of two or more IR dosage forms given sequentially.

It is a further object of the invention to provide a multiparticulate modified release composition which in operation delivers an active ingredient in a pulsatile manner.

Another object of the invention is to provide a multiparticulate modified release composition which substantially mimics the pharmacological and therapeutic effects produced by the administration of two or more IR dosage forms given sequentially.

Another object of the present invention is to provide a multiparticulate modified release composition which substantially reduces or eliminates the development of patient tolerance to the active ingredient of the composition.

Another object of the invention is to provide a multiparticulate modified release composition in which a first portion of the active ingredient is released immediately upon administration and a second portion of the active ingredient is released rapidly after an initial delay period in a bimodal manner.

Another object of the invention is to provide a multiparticulate modified release composition capable of releasing the active ingredient in a bimodal or multi-modal manner in which a first portion of the active ingredient is released either immediately or after a delay time to provide a pulse of drug release and one or more additional portions of the active ingredient are released each after a respective lag time to provide additional pulses of drug release.

Another object of the invention is to provide solid oral dosage forms comprising a multiparticulate modified release composition of the present invention.

4

Other objects of the invention include provision of a once daily dosage form of methylphenidate which, in operation, produces a plasma profile substantially similar to the plasma profile produced by the administration of two immediate release dosage forms given sequentially and a method for treatment of attention deficit disorder based on administration of such a dosage form.

BRIEF DESCRIPTION OF THE INVENTION

10 The above objects are realised by a multiparticulate modified release composition having a first component comprising a first population of active ingredient-containing particles and a second component comprising a second population of active ingredient-containing particles. The active ingredient contained in the first and second components can be the same or different and active ingredient-containing particles of the second component are coated with a modified release coating. Alternatively or additionally, the second population of active ingredient-containing particles further comprises a modified release matrix material. Following oral delivery, the composition in operation delivers the active ingredient or active ingredients in a pulsatile manner.

25 In a preferred embodiment of a multiparticulate modified release composition according to the invention the first component is an immediate release component.

The modified release coating applied to the second population of active ingredient containing particles causes a lag time between the release of active ingredient from the first population of active ingredient containing particles and the release of active ingredient from the second population of active ingredient containing particles. Similarly, the presence of a modified release matrix material in the second population of active ingredient containing particles causes a lag time between the release of active ingredient from the first population of active ingredient containing particles and the release of active ingredient from the second population of active ingredient containing particles. The duration of the lag time may be varied by altering the composition and/or the amount of the modified release coating and/or altering the composition and/or amount of modified release matrix material utilised. Thus, the duration of the lag time can be designed to mimic a desired plasma profile.

45 Because the plasma profile produced by the multiparticulate modified release composition upon administration is substantially similar to the plasma profile produced by the administration of two or more IR dosage forms given sequentially, the multiparticulate controlled release composition of the present invention is particularly useful for administering active ingredients for which patient tolerance may be problematical. This multiparticulate modified release composition is therefore advantageous for reducing or minimising the development of patient tolerance to the active ingredient in the composition.

55 In a preferred embodiment of the present invention, the active ingredient is methylphenidate and the composition in operation delivers the active ingredient in a bimodal or pulsed manner. Such a composition in operation produces a plasma profile which substantially mimics that obtained by the sequential administration of two IR doses as, for instance, in a typical methylphenidate treatment regime.

The present invention also provides solid oral dosage forms comprising a composition according to the invention.

60 The present invention further provides a method of treating an animal, particularly a human in need of treatment utilising the active ingredient, comprising administering a

US 6,730,325 B2

5

therapeutically effective amount of a composition or solid oral dosage form according to the invention to provide pulsed or bimodal administration of the active ingredient. Advantages of the present invention include reducing the dosing frequency required by conventional multiple IR dosage regimes while still maintaining the benefits derived from a pulsatile plasma profile. This reduced dosing frequency is particularly advantageous in the case of children in that it eliminates the need for dosing during the middle of the school day which can be both disruptive and embarrassing for the patient. It is also advantageous in terms of patient compliance to have a formulation which may be administered at reduced frequency. The reduction in dosage frequency made possible by utilising the present invention would contribute to reducing health care costs by reducing the amount of time spent by health care workers on the administration of drugs. In the case of methylphenidate, and other controlled substances, the use of a once-daily formulation (in place of multiple IR doses) reduces or eliminates the need for the storage of controlled substances on the premises of schools or other institutions.

DESCRIPTION OF THE DRAWINGS

FIG. 1 shows methylphenidate plasma profiles following oral administration of the following three formulations to human volunteers: A—20 mg methylphenidate formulation having an immediate release component comprising particles containing a total of 10 mg methylphenidate (according to Table 1 (ii)) and a modified release component comprising particles containing a total of 10 mg methylphenidate (according to Table 2 (viii); IR particles coated to a 30% weight gain); B—20 mg methylphenidate formulation having an immediate release component comprising particles containing a total 10 mg methylphenidate (according to Table 1 (ii)) and a modified release component comprising particles containing a total of 10 mg methylphenidate (according to Table 2 (vii); IR particles coated to a 30% weight gain); and Control—two doses of 10 mg Ritalin® Hydrochloride (IR) tablets administered at times 0 and 4 hours (total of 20 mg methylphenidate administered).

DETAILED DESCRIPTION OF THE INVENTION

The term "particulate" as used herein refers to a state of matter which is characterised by the presence of discrete particles, pellets, beads or granules irrespective of their size, shape or morphology. The term "multiparticulate" as used herein means a plurality of discrete, or aggregated, particles, pellets, beads, granules or mixture thereof irrespective of their size, shape or morphology.

The term "modified release" as used herein in relation to the composition according to the invention or a coating or coating material or used in any other context means release which is not immediate release and is taken to encompass controlled release, sustained release and delayed release.

The term "time delay" as used herein refers to the duration of time between administration of the composition and the release of the active ingredient from a particular component.

The term "lag time" as used herein refers to the time between delivery of active ingredient from one component and the subsequent delivery of active ingredient from another component.

The invention will be described in detail with respect to methylphenidate as a specific example of an active ingredient particularly suited to formulation in a multiparticulate modified release composition according to the present invention.

6

The multiparticulate modified release composition of the invention may have more than two active ingredient-containing components. In this case the release of active ingredient from the second and subsequent components is modified such that there is a lag time between the release of active ingredient from the first component and each subsequent component. The number of pulses in the profile arising from such a composition in operation will depend on the number of active ingredient containing components in the composition. A composition containing three active ingredient-containing components will give rise to three pulses in the profile.

Any active ingredient for which it is useful to combine the advantages of a pulsatile plasma profile with a reduced frequency dosage regime may be used in practice of the present invention. Particularly useful in the practice of the invention include active ingredients whose pharmacological and/or therapeutic effects benefit from having a wash-out period between plasma concentration peaks, such as those active ingredients susceptible to the development of patient tolerance. Example active ingredients include but are not limited to peptides or proteins, hormones, analgesics, anti-migraine agents, anti-coagulant agents, narcotic antagonists, chelating agents, anti-anginal agents, chemotherapy agents, sedatives, anti-neoplastics, prostaglandins and antidiuretic agents, drug compounds acting on the central nervous system such as cerebral stimulants, for example methylphenidate; pain management active ingredients, alkaloids such as opiates, for example morphine; cardiovascular drugs, such as nitrates; and agents for treating rheumatic conditions. It is further appreciated that the present invention may be used to deliver a number of drugs including, but not limited to, peptides, proteins or hormones such as insulin, calcitonin, calcitonin gene regulating protein, atrial natriuretic protein, colony stimulating factor, betaseron, erythropoietin (EPO), interferons such as α , β or γ interferon, somatropin, somatotropin, somastostatin, insulin-like growth factor (somatomedins), luteinizing hormone releasing hormone (LHRH), tissue plasminogen activator (TPA), growth hormone releasing hormone (GHRH), oxytocin, estradiol, growth hormones, leuprorelin acetate, factor VIII, interleukins such as interleukin-2, and analogues thereof; analgesics such as fentanyl, sufentanil, butorphanol, buprenorphine, levorphanol, morphine, hydromorphone, hydrocodone, oxymorphone, methadone, lidocaine, bupivacaine, diclofenac, naproxen, paverin, and analogues thereof; anti-migraine agents such as sumatriptan, ergot alkaloids, and analogues thereof; anti-coagulant agents such as heparin, hirudin, and analogues thereof; anti-emetic agents such as scopolamine, ondansetron, domperidone, metoclopramide, and analogues thereof; cardiovascular agents, anti-hypertensive agents and vasodilators such as diltiazem, clonidine, nifedipine, verapamil, isosorbide-5-mononitrate, organic nitrates, agents used in treatment of heart disorders, and analogues thereof; sedatives such as benzodiazepines, phenothiazines, and analogues thereof; chelating agents such as deferoxamine, and analogues thereof; anti-diuretic agents such as desmopressin, vasopressin, and analogues thereof; anti-anginal agents such as nitroglycerine, and analogues thereof; anti-neoplastics such as fluorouracil, bleomycin, and analogues thereof; prostaglandins and analogues thereof; and chemotherapy agents such as vincristine, and analogues thereof.

The active ingredient in each component may be the same or different. For example, a composition in which the first component contains a first active ingredient and the second component comprises a second active ingredient may be

US 6,730,325 B2

7

desirable for combination therapies. Indeed, two or more active ingredients may be incorporated into the same component when the active ingredients are compatible with each other. A drug compound present in one component of the composition may be accompanied by, for example, an enhancer compound or a sensitiser compound in another component of the composition, in order to modify the bioavailability or therapeutic effect of the drug compound.

As used herein, the term "enhancer" refers to a compound which is capable of enhancing the absorption and/or bioavailability of an active ingredient by promoting net transport across the GIT in an animal, such as a human. Enhancers include but are not limited to medium chain fatty acids; salts, esters, ethers and derivatives thereof, including glycerides and triglycerides; non-ionic surfactants such as those that can be prepared by reacting ethylene oxide with a fatty acid, a fatty alcohol, an alkylphenol or a sorbitan or glycerol fatty acid ester; cytochrome P450 inhibitors, P-glycoprotein inhibitors and the like; and mixtures of two or more of these agents.

The proportion of active ingredient contained in each component may be the same or different depending on the desired dosing regime. The active ingredient may be present, in the first component individually or in combination with the active ingredient (or active ingredients) in the second component, in any amount sufficient to elicit a therapeutic response. The active ingredient (or active ingredients), when applicable, may be present either in the form of one substantially optically pure enantiomer or as a mixture, racemic or otherwise, of enantiomers. The active ingredient is preferably present in a composition in an amount of from 0.1–500 mg, preferably in the amount of from 1–100 mg. When the active ingredient is methylphenidate, it is preferably present in the first component in an amount of from 0.5–60 mg; more preferably the active ingredient is present in the first component in an amount of from 2.5–30 mg. The active ingredient is present in the subsequent components in an amount within a similar range to that described for the first component.

The time release characteristics for the release of the active ingredient from each of the components may be varied by modifying the composition of each component, including modifying any of the excipients or coatings which may be present. In particular the release of the active may be controlled by changing the composition and/or the amount of the modified release coating on the particles, if such a coating is present. If more than one modified release component is present, the modified release coating for each of these components may be the same or different. Similarly, when modified release is facilitated by the inclusion of a modified release matrix material, release of the active ingredient may be controlled by the choice and amount of modified release matrix material utilised. The modified release coating may be present, in each component, in any amount that is sufficient to yield the desired delay time for each particular component. The modified release coating may be preset, in each component, in any amount that is sufficient to yield the desired time lag between components.

The lag time or delay time for the release of the active ingredient from each component may also be varied by modifying the composition of each of the components, including modifying any excipients and coatings which may be present. For example the first component may be an immediate release component wherein the active ingredient is released substantially immediately upon administration. Alternatively, the first component may be, for example, a time-delayed immediate release component in which the

8

active ingredient is released substantially immediately after a time delay. The second component may be, for example, a time-delayed immediate release component as just described or, alternatively, a time-delayed sustained release or extended release component in which the active ingredient is released in a controlled fashion over an extended period of time.

As will be appreciated by those skilled in the art, the exact nature of the plasma concentration curve will be influenced by the combination of all of these factors just described. In particular, the lag time between the delivery (and thus also the on-set of action) of the active ingredient in each component may be controlled by varying the composition and coating (if present) of each of the components. Thus by variation of the composition of each component (including the amount and nature of the active ingredient(s)) and by variation of the lag time, numerous release and plasma profiles may be obtained. Depending on the duration of the lag time between the release of active ingredient from each component and the nature of the release from each component (i.e. immediate release, sustained release etc.), the pulses in the plasma profile may be well separated and clearly defined peaks (e.g. when the lag time is long) or the pulses may be superimposed to a degree (e.g. in when the lag time is short).

In a preferred embodiment, the multiparticulate modified release composition according to the present invention has an immediate release component and at least one modified release component, the immediate release component comprising a first population of active ingredient containing particles and the modified release components comprising second and subsequent populations of active ingredient containing particles. The second and subsequent modified release components may comprise a controlled release coating. Additionally or alternatively, the second and subsequent modified release components may comprise a modified release matrix material. In operation, administration of such a multiparticulate modified release composition having, for example, a single modified release component results in characteristic pulsatile plasma concentration levels of the active ingredient in which the immediate release component of the composition gives rise to a first peak in the plasma profile and the modified release component gives rise to a second peak in the plasma profile. Embodiments of the invention comprising more than one modified release component give rise to further peaks in the plasma profile.

Such a plasma profile produced from the administration of a single dosage unit is advantageous when it is desirable to deliver two (or more) pulses of active ingredient without the need for administration of two (or more) dosage units. Additionally, in the case of some disorders it is particularly useful to have such a bimodal plasma profile. For example, a typical methylphenidate treatment regime consists of administration of two doses of an immediate release dosage formulation given four hours apart. This type of regime has been found to be therapeutically effective and is widely used. The plasma profile produced by such an administration regime is illustrated by the "Control" curve in FIG. 1. As previously mentioned, the development of patient tolerance is an adverse effect sometimes associated with methylphenidate treatments. It is believed that the trough in the plasma profile between the two peak plasma concentrations is advantageous in reducing the development of patient tolerance by providing a period of wash out of the active ingredient. Drug delivery systems which provide zero order or pseudo zero order delivery of the active ingredient do not facilitate this wash out process.

US 6,730,325 B2

9

Any coating material which modifies the release of the active ingredient in the desired manner may be used. In particular, coating materials suitable for use in the practice of the invention include but are not limited to polymer coating materials, such as cellulose acetate phthalate, cellulose acetate trimaleate, hydroxy propyl methylcellulose phthalate, polyvinyl acetate phthalate, ammonio methacrylate copolymers such as those sold under the Trade Mark Eudragit® RS and RL, poly acrylic acid and poly acrylate and methacrylate copolymers such as those sold under the Trade Mark Eudragite S and L, polyvinyl acetaldieethylamino acetate, hydroxypropyl methylcellulose acetate succinate, shellac; hydrogels and gel-forming materials, such as carboxyvinyl polymers, sodium alginate, sodium carmellose, calcium carmellose, sodium carboxymethyl starch, poly vinyl alcohol, hydroxyethyl cellulose, methyl cellulose, gelatin, starch, and cellulose based cross-linked polymers—in which the degree of crosslinking is low so as to facilitate adsorption of water and expansion of the polymer matrix, hydroxypropyl cellulose, hydroxypropyl methylcellulose, polyvinylpyrrolidone, crosslinked starch, microcrystalline cellulose, chitin, aminoacryl-methacrylate copolymer (Eudragit® RS-PM, Rohm & Haas), pullulan, collagen, casein, agar, gum arabic, sodium carboxymethyl cellulose, (swellable hydrophilic polymers) poly (hydroxalkyl methacrylate) (m. wt. ~5 k-5,000 k), polyvinylpyrrolidone (m. wt. ~10 k-360 k), anionic and cationic hydrogels, polyvinyl alcohol having a low acetate residual, a swellable mixture of agar and carboxymethyl cellulose, copolymers of maleic anhydride and styrene, ethylene, propylene or isobutylene, pectin (m. wt. ~30 k-300 k), polysaccharides such as agar, acacia, karaya, tragacanth, algin and guar, polyacrylamides, Polyox® polyethylene oxides (m. wt. ~100 k-5,000 k), AquaKeep® acrylate polymers, diesters of polyglucan, crosslinked polyvinyl alcohol and poly N-vinyl-2-pyrrolidone, sodium starch gluconate (e.g. Explotab®, Edward Mandell C. Ltd.), hydrophilic polymers such as polysaccharides, methyl cellulose, sodium or calcium carboxymethyl cellulose, hydroxypropyl methyl cellulose, hydroxypropyl cellulose, hydroxyethyl cellulose, nitro cellulose, carboxymethyl cellulose, cellulose ethers, polyethylene oxides (e.g. Polyox®, Union Carbide), methyl ethyl cellulose, ethylhydroxy ethylcellulose, cellulose acetate, cellulose butyrate, cellulose propionate, gelatin, collagen, starch, maltodextrin, pullulan, polyvinyl pyrrolidone, polyvinyl alcohol, polyvinyl acetate, glycerol fatty acid esters, polyacrylamide, polyacrylic acid, copolymers of methacrylic acid or methacrylic acid (e.g. Eudragit®, Rohm and Haas), other acrylic acid derivatives, sorbitan esters, natural gums, lecithins, pectin, alginates, ammonia alginate, sodium, calcium, potassium alginates, propylene glycol alginate, agar, and gums such as arabic, karaya, locust bean, tragacanth, carrageens, guar, xanthan, scleroglucan and mixtures and blends thereof. As will be appreciated by the person skilled in the art, excipients such as plasticisers, lubricants, solvents and the like may be added to the coating. Suitable plasticisers include for example acetylated monoglycerides; butyl phthalyl butyl glycolate; dibutyl tartrate; diethyl phthalate; dimethyl phthalate; ethyl phthalyl ethyl glycolate; glycerin; propylene glycol; triacetin; citrate; tripropoin; diacetin; dibutyl phthalate; acetyl monoglyceride; polyethylene glycols; castor oil; triethyl citrate; polyhydric alcohols, glycerol, acetate esters, glycerol triacetate, acetyl triethyl citrate, dibenzyl phthalate, dihexyl phthalate, butyl octyl phthalate, diisomonyl

10

phthalate, butyl octyl phthalate, dioctyl azelate, epoxidised tallate, triisooctyl trimellitate, diethylhexyl phthalate, di-n-octyl phthalate, di-i-octyl phthalate, di-i-decyl phthalate, di-n-undecyl phthalate, di-n-tridecyl phthalate, tri-2-ethylhexyl trimellitate, di-2-ethylhexyl adipate, di-2-ethylhexyl sebacate, di-2-ethylhexyl azelate, dibutyl sebacate.

When the modified release component comprises a modified release matrix material, any suitable modified release matrix material or suitable combination of modified release matrix materials may be used. Such materials are known to those skilled in the art. The term "modified release matrix material" as used herein includes hydrophilic polymers, hydrophobic polymers and mixtures thereof which are capable of modifying the release of an active ingredient dispersed therein *in vitro* or *in vivo*. Modified release matrix materials suitable for the practice of the present invention include but are not limited to microcrystalline cellulose, sodium carboxymethylcellulose, hydroxyalkylcelluloses such as hydroxypropylmethylcellulose and hydroxypropylcellulose, polyethylene oxide, alkylcelluloses such as methylcellulose and ethylcellulose, polyethylene glycol, polyvinylpyrrolidone, cellulose acetate, cellulose acetate butyrate, cellulose acetate phthalate, cellulose acetate trimellitate, polyvinylacetate phthalate, polyalkylmethacrylates, polyvinyl acetate and mixture thereof.

A multiparticulate modified release composition according to the present invention may be incorporated into any suitable dosage form which facilitates release of the active ingredient in a pulsatile manner. Typically, the dosage form may be a blend of the different populations of active ingredient containing particles which make up the immediate release and the modified release components, the blend being filled into suitable capsules, such as hard or soft gelatin capsules. Alternatively, the different individual populations of active ingredient containing particles may be compressed (optionally with additional excipients) into mini-tablets which may be subsequently filled into capsules in the appropriate proportions. Another suitable dosage form is that of a multilayer tablet. In this instance the first component of the multiparticulate modified release composition may be compressed into one layer, with the second component being subsequently added as a second layer of the multilayer tablet. The populations of active ingredient containing particles making up the composition of the invention may further be included in rapidly dissolving dosage forms such as an effervescent dosage form or a fast-melt dosage form.

The composition according to the invention comprises at least two populations of active ingredient containing particles which have different *in vitro* dissolution profiles.

Preferably, in operation the composition of the invention and the solid oral dosage forms containing the composition release the active ingredient such that substantially all of the active ingredient contained in the first component is released prior to release of the active ingredient from the second component. When the first component comprises an IR component, for example, it is preferable that release of the active ingredient from the second component is delayed until substantially all the active ingredient in the IR component has been released. Release of the active ingredient from the second component may be delayed as detailed above by the use of a modified release coating and/or a modified release matrix material.

US 6,730,325 B2

11

More preferably, when it is desirable to minimise patient tolerance by providing a dosage regime which facilitates wash-out of a first dose of active ingredient from a patient's system, release of the active ingredient from the second component is delayed until substantially all of the active ingredient contained in the first component has been released, and further delayed until at least a portion of the active ingredient released from the first component has been cleared from the patient's system. In a preferred embodiment, release of the active ingredient from the second component of the composition in operation is substantially, if not completely, delayed for a period of at least about two hours after administration of the composition.

When the active ingredient is methylphenidate, release of the active ingredient from the second component of the composition in operation is substantially, if not completely, delayed for a period of at least about four hours, preferably about four hours, after administration of the composition.

In the following Examples all percentages are weight by weight unless otherwise stated. The term "purified water" as used throughout the Examples refers to water that has been purified by passing it through a water filtration system.

EXAMPLE 1

Multiparticulate Modified Release Composition Containing Methylphenidate

A multiparticulate modified release composition according to the present invention comprising an immediate release component and a modified release component and containing methylphenidate as the active ingredient is prepared as follows.

(a) Immediate Release Component.

A solution of methylphenidate HCl (50:50 racemic mixture) is prepared according to any of the formulations given in Table 1. The methylphenidate solution is then coated onto nonpareil seeds to a level of approximately 16.9% solids weight gain using, for example, a Glatt GPCG3 (Glatt, Protech Ltd., Leicester, UK) fluid bed coating apparatus to form the IR particles of the immediate release component.

TABLE 1

Ingredient	<u>Amount, % (w/w)</u>	
	(i)	(ii)
Methylphenidate HCl	13.0	13.0
Polyethylene Glycol 6000	0.5	0.5
Polyvinylpyrrolidone	3.5	
Purified Water	83.5	86.5

(b) Modified Release Component

Methylphenidate containing delayed release particles are prepared by coating immediate release particles prepared according to Example 1(a) above with a modified release coating solution as detailed in Table 2. The immediate release particles are coated to varying levels up to approximately to 30% weight gain using, for example, a fluid bed apparatus.

12

TABLE 2

Ingredient	<u>Modified release component coating solutions</u>							
	<u>Amount, % (w/w)</u>							
(i)	(ii)	(iii)	(iv)	(v)	(vi)	(vii)	(viii)

Diethylphthalate	0.5	0.5	0.6	1.35	0.6	1.3	1.1	—
Triethylcitrate	—	—	—	—	—	—	—	1.25
Isopropyl alcohol	39.8	33.1	37.2	45.1	33.8	44.35	49.6	46.5
Acetone	10.0	8.3	9.3	—	8.4	—	—	—
Talc ¹	—	16.0	5.9	—	16.3	—	2.8	2.25

¹Talc is simultaneously applied during coating for formulations in column (i), (iv) and (vi).

(c) Dissolution Testing

pH independent coated components ((i) to (v) Table 2) are tested in vitro in USP Type 1 apparatus (100 rpm) according to the following protocol: the sample is placed in 0.01 N HCl (900 ml), pH 2.0, 37° C. for all of the sampling time points.

pH dependent coated components ((vi) to (viii) Table 2) are tested in USP Type I apparatus (100 rpm) according to a modified version of the United States Pharmacopoeia method for enteric protection (USP 23, 1995, p.1795): the sample is placed for 2 hours in 0.01 N HCl and then transferred to phosphate buffer pH 6.8 for the remainder of the sampling time points.

IR components were formulated using three different sizes of non-pareil seeds having diameter dimensions of 0.5–0.6, 0.6–0.71 and 0.71–0.85 mm, respectively. The IR particles formed by coating 0.5–0.6, 0.6–0.71 and 0.71–0.85 mm non-pareil seeds were found to release 100% of the active ingredient within 20 minutes in aqueous media.

Dissolution data for the modified release components prepared according to Example 1(b) above are shown in Tables 3(a) to 3(c). This data shows that release characteristics of the modified release component can be varied by changing the composition and thickness of the coating applied.

10	94.3	67.5	48.4	69.0	91.4	79.6	79.2	63.9

(the notation "—" indicates no measurement taken;

*indicates pH of phosphate buffer was 7.4 instead of 6.8)

(d) Encapsulation of Immediate and Delayed Release Particles.

The immediate and delayed release particles prepared according to Example 1(a) and (b) above are encapsulated in size 2 hard gelatin capsules to an overall 20 mg dosage strength using, for example, a Bosch GKF 4000S encapsulation apparatus. The overall dosage strength of 20 mg methylphenidate was made up of 10 mg from the immediate release component and 10 mg from the modified release component.

14

Table 4 shows the dissolution profiles for two multiparticulate modified release compositions prepared using the immediate release coating solution given in Table 1 (ii) and the modified release coating solutions given in Table 2 (vii) and (viii). These results indicate that approximately 50% of the methylphenidate HCl active ingredient was released within the first half hour with release from the modified release component being delayed for about four hours.

TABLE 4

Dissolution data for compositions containing an IR component and a modified release component

Coating level (% weight increase)	MR coating formulation	
	(vii) 30%	(viii) 30%
0	0	0
0.5	49.7	50.2
1	49.7	50.5
2	49.8	51.1
4	56.1	54.1
6	65.2	68.0
8	72.2	81.8
10	76.6	87.0

The dissolution profiles shown in Table 4 indicate that the compositions containing the pH dependent coated components release the methylphenidate active ingredient in a pulsed manner. A first pulse occurs before 1 hour followed by a plateau region where the release of further amounts of the active ingredient is suppressed. The plateau region is in turn followed by a second pulse of active ingredient release as indicated by the increase in drug concentration from 4 hours onward.

EXAMPLE 2

40 Multiparticulate Modified Release Composition Containing Methylphenidate

Multiparticulate modified release methylphenidate compositions according to the present invention having an immediate release component and a modified release component having a modified release matrix material are prepared according to the formulations shown in Table 5(a) and (b).

(e) In Vivo Release

In a human cross-over biostudy, fasted healthy volunteers were dosed with 20 mg methylphenidate HCl compositions according to the present invention to compare the bioavailability of methylphenidate HCl in these compositions relative to Ritalin® (Novartis; 10 mg dosed twice at a four hour interval). Pharmacokinetic assessment was based on the plasma levels of methylphenidate measured by blood sampling at regular intervals up to 48 hours after administration. Blood samples were also taken for pre- and post-study screening.

Referring now to FIG. 1, the plasma profiles labelled "A" (modified component comprises IR particles coated with coating Table 2 (viii) at 30%) and "B" (modified component comprises IR particles coated with coating Table 2 (vii) at 30%) correspond to the plasma concentrations of methylphenidate observed in human volunteers after oral administration of the multiparticulate modified release compositions prepared according to Example 1. In both cases the plasma profile is qualitatively similar to the control, typical of prior art treatments (labelled "Control" in FIG. 1), which consists of two doses of Ritalin® IR given sequentially, four hours apart.

For the multiparticulate modified release composition according to the present invention prepared according to Example 1 above, the first peak in the plasma profile associated with the immediate release component is similar in terms of c_{max} and peak width to the peak associated with the first dose of Ritalin® in the control profile. Profile A shows that the trough characteristic of the conventional twice daily administration (as exemplified by the control profile) is mimicked by the composition prepared according to the invention. Profile B also shows a significant fall off after the initial peak in plasma concentration. For both multiparticulate modified release compositions, the effect of the modified release component is to increase plasma concentrations four hours after administration resulting in a second peak level. This observed effect again mimics the control.

From FIG. 1 it is clear that the multiparticulate modified release compositions prepared according to the present invention mimic a typical twice daily treatment (represented by the control) in terms of the plasma profile achieved upon administration. This in vivo release of methylphenidate from compositions according to the invention was achieved without any loss in bioavailability compared to Ritalin® dosed twice daily.

In a separate study, 34 children with ADHD were dosed with 20 mg methylphenidate HCl compositions according to the present invention. A simulated classroom design was

16

used to compare formulations "A" and "B" (corresponding to the "A" and "B" formulations described above) with placebo. Pharmacodynamic assessments were conducted over a 9 hour time period which measured both attention and deportment as measured on the SKAMP scale and functional outcome as measured by the number of math problems attempted and the number of correct answers. Each formulation demonstrated a statistical difference from placebo on all efficacy measurements. The individual efficacy evaluations showed that the "A" and "B" formulations proved to be similar with regard to deportment. With regard to attention and functional outcome, the children on the "A" formulation appeared to focus more on the tasks at hand and attempted more math problems more quickly between 4 and 6 hours than the children taking the "B" formulation.

The present invention is not to be limited in scope by the specific embodiments described herein. Various modifications of the invention in addition to those described herein will become apparent to those skilled in the art from the foregoing description and the following claims.

What is claimed is:

1. A multiparticulate modified release composition comprising a first population of active ingredient-containing particles and at least one subsequent population of active ingredient-containing particles, wherein the active ingredient contained in the first population is a drug compound that acts on the central nervous system, and the subsequent population of active ingredient-containing particles further comprises a modified release coating or, alternatively or additionally, a modified release matrix material, such that the composition following oral delivery to a subject delivers the active ingredients in the first and subsequent populations in a pulsatile manner.
2. The composition according to claim 1, comprising a first population and one subsequent population.
3. The composition according to claim 2, wherein the first population comprises immediate-release particles and the subsequent population comprises modified-release particles.
4. The composition according to claim 3, wherein the modified release particles have a modified-release coating.
5. The composition according to claim 2, wherein the modified release particles comprise a modified-release matrix material.
6. The composition according to claim 1, wherein the first population contains a cerebral stimulant.
7. The composition according to claim 1, wherein the first population contains methylphenidate or a pharmaceutically acceptable salt thereof, an enantiomer or a mixture thereof racemic or otherwise, or a mixture thereof.
8. The composition according to claim 1, wherein the composition contains at least one additional active ingredient.
9. The composition according to claim 1, wherein at least one of the first and subsequent populations further comprises an enhancer.
10. The composition according to claim 1, wherein the amount of active ingredient contained in each of the first and subsequent populations is from about 0.1 mg to about 1 g.
11. The composition according to claim 1, wherein the first and subsequent populations have different in vitro dissolution profiles.
12. The composition according to claim 1, wherein the particles of the first population comprise immediate-release particles and the particles of the subsequent population comprise modified-release particles.
13. The composition according to claim 12, which in operation releases substantially all of the active ingredient

US 6,730,325 B2

17

from the first population prior to release of the active ingredient from the subsequent population.

14. The composition according to claim 1, wherein the in vivo release in the subject of the active ingredients from the first and subsequent populations mimics the in vivo release of the same active ingredients administered in the form of two or more doses of immediate-release forms of the active ingredients.

15. The composition according to claim 13, wherein the mean in vitro dissolution profile in an aqueous medium is such that substantially all of the active ingredient of the first population is released within about two hours.

16. A dosage form comprising a composition according to claim 1.

17. A dosage form comprising a composition according to claim 6.

18. A dosage form comprising a composition according to claim 2.

19. The dosage form according to claim 16 comprising a blend of the particles of each of the first and subsequent populations contained in a hard gelatin or soft gelatin capsule.

20. The dosage form according to claim 19, wherein the particles of each of the populations are in the form of mini-tablets and the capsule contains a mixture of the mini-tablets.

21. The dosage form according to claim 16 in the form of a multilayer tablet comprising a first layer of compressed

18

active ingredient-containing particles of the first population and another layer of compressed active ingredient-containing particles of the subsequent population.

22. The dosage form according to claim 16, wherein the first and subsequent populations of active ingredient-containing particles are provided in a rapidly dissolving dosage form.

23. The dosage form according to claim 22, comprising a fast-melt tablet.

24. A method for the treatment of attention deficit disorder comprising administering a therapeutically effective amount of a composition according to claim 7.

25. The composition according to claim 2, wherein the modified-release particles comprise a pH-dependent polymer coating which is effective in releasing a pulse of the active ingredient following a time delay.

26. The composition according to claim 25, wherein the polymer coating comprises methacrylate copolymers.

27. The composition according to claim 25, wherein the polymer coating comprises a mixture of methacrylate and ammonio methacrylate copolymers in a ratio sufficient to achieve a pulse of the active ingredient following a time delay.

28. The composition according to claim 27, wherein the ratio of methacrylate to ammonio methacrylate copolymers is 1:1.

INSTRUCTIONS FOR ATTORNEYS COMPLETING CIVIL COVER SHEET FORM JS 44**Authority For Civil Cover Sheet**

The JS 44 civil cover sheet and the information contained herein neither replaces nor supplements the filings and service of pleading or other papers as required by law, except as provided by local rules of court. This form, approved by the Judicial Conference of the United States in September 1974, is required for the use of the Clerk of Court for the purpose of initiating the civil docket sheet. Consequently, a civil cover sheet is submitted to the Clerk of Court for each civil complaint filed. The attorney filing a case should complete the form as follows:

I. (a) Plaintiffs-Defendants. Enter names (last, first, middle initial) of plaintiff and defendant. If the plaintiff or defendant is a government agency, use only the full name or standard abbreviations. If the plaintiff or defendant is an official within a government agency, identify first the agency and then the official, giving both name and title.

(b) County of Residence. For each civil case filed, except U.S. plaintiff cases, enter the name of the county where the first listed plaintiff resides at the time of filing. In U.S. plaintiff cases, enter the name of the county in which the first listed defendant resides at the time of filing. (NOTE: In land condemnation cases, the county of residence of the "defendant" is the location of the tract of land involved.)

(c) Attorneys. Enter the firm name, address, telephone number, and attorney of record. If there are several attorneys, list them on an attachment, noting in this section "(see attachment)".

II. Jurisdiction. The basis of jurisdiction is set forth under Rule 8(a), F.R.C.P., which requires that jurisdictions be shown in pleadings. Place an "X" in one of the boxes. If there is more than one basis of jurisdiction, precedence is given in the order shown below.

United States plaintiff. (1) Jurisdiction based on 28 U.S.C. 1345 and 1348. Suits by agencies and officers of the United States are included here.

United States defendant. (2) When the plaintiff is suing the United States, its officers or agencies, place an "X" in this box.

Federal question. (3) This refers to suits under 28 U.S.C. 1331, where jurisdiction arises under the Constitution of the United States, an amendment to the Constitution, an act of Congress or a treaty of the United States. In cases where the U.S. is a party, the U.S. plaintiff or defendant code takes precedence, and box 1 or 2 should be marked.

Diversity of citizenship. (4) This refers to suits under 28 U.S.C. 1332, where parties are citizens of different states. When Box 4 is checked, the citizenship of the different parties must be checked. (See Section III below; federal question actions take precedence over diversity cases.)

III. Residence (citizenship) of Principal Parties. This section of the JS 44 is to be completed if diversity of citizenship was indicated above. Mark this section for each principal party.

IV. Nature of Suit. Place an "X" in the appropriate box. If the nature of suit cannot be determined, be sure the cause of action, in Section VI below, is sufficient to enable the deputy clerk or the statistical clerks in the Administrative Office to determine the nature of suit. If the cause fits more than one nature of suit, select the most definitive.

V. Origin. Place an "X" in one of the seven boxes.

Original Proceedings. (1) Cases which originate in the United States district courts.

Removed from State Court. (2) Proceedings initiated in state courts may be removed to the district courts under Title 28 U.S.C., Section 1441. When the petition for removal is granted, check this box.

Remanded from Appellate Court. (3) Check this box for cases remanded to the district court for further action. Use the date of remand as the filing date.

Reinstated or Reopened. (4) Check this box for cases reinstated or reopened in the district court. Use the reopening date as the filing date.

Transferred from Another District. (5) For cases transferred under Title 28 U.S.C. Section 1404(a). Do not use this for within district transfers or multidistrict litigation transfers.

Multidistrict Litigation. (6) Check this box when a multidistrict case is transferred into the district under authority of Title 28 U.S.C. Section 1407. When this box is checked, do not check (5) above.

Appeal to District Judge from Magistrate Judgment. (7) Check this box for an appeal from a magistrate judge's decision.

VI. Cause of Action. Report the civil statute directly related to the cause of action and give a brief description of the cause. **Do not cite jurisdictional statutes unless diversity.** Example: U.S. Civil Statute: 47 USC 553
Brief Description: Unauthorized reception of cable service

VII. Requested in Complaint. Class Action. Place an "X" in this box if you are filing a class action under Rule 23, F.R.Cv.P.

Demand. In this space enter the dollar amount (in thousands of dollars) being demanded or indicate other demand such as a preliminary injunction.

Jury Demand. Check the appropriate box to indicate whether or not a jury is being demanded.

VIII. Related Cases. This section of the JS 44 is used to reference related pending cases if any. If there are related pending cases, insert the docket numbers and the corresponding judge names for such cases.

Date and Attorney Signature. Date and sign the civil cover sheet.

AO FORM 85 RECEIPT (REV. 9/04)

United States District Court for the District of Delaware
